

MYMONA MUHISEN

Software Engineering Student — Frontend

Damascus, Syria · mymonamh2004@gmail.com · +963 968 190 380 · [LinkedIn](#) · [GitHub](#)

EDUCATION

B.Sc. in Software Engineering

Expected 2027

Alsham Private University (ASPU) · GPA: 3.09 / 4.0

SKILLS

Languages: C++, Java, JavaScript

Frontend: React, HTML, CSS

CS Fundamentals: Object-Oriented Programming (OOP), Data Structures, Problem Solving

Tools & Other: Git, SQL (SSMS), UML / System Diagrams

PROJECTS

That al ahead (ذات العهد) | React, JavaScript

[GitHub ↗](#)

- Built the complete frontend for an Arabic electronic-contracts platform for the Syrian market, featuring AI-assisted clause warnings and digital signature workflows.
- Contributed to the project proposal and system diagrams alongside a two-person team, covering the full path from requirements to a working UI.

Flight Booking System | Java · Individual Project

[GitHub ↗](#)

- Independently designed and built a full flight reservation system applying core OOP principles: inheritance (Person → Employee / Traveler), encapsulation, and enum-based dynamic pricing by flight class.
- Structured booking, payment, ticketing, and cancellation as separate, cohesive modules with file-based persistence.

Visa Service Center — v1 | C++

[GitHub ↗](#)

- Implemented a custom AVL Tree (template-based) for balanced, $O(\log n)$ storage and lookup of citizen and employee records.
- Used a Stack structure to log and time-search service procedures.

Visa Service Center — v2 | C++

[GitHub ↗](#)

- Redesigned the center's core data structure from a search tree to a priority-based service queue: a custom templated Linked List underlying a Priority Queue.
- Applied polymorphism via a shared Printable interface and simulated real-time transaction processing with multithreading.

AI Maze Solver | Python

[GitHub ↗](#)

- Implemented 6 pathfinding algorithms — BFS, DFS, UCS, Bidirectional Search, A*, and Swarm Search — including 3 A* heuristics (Manhattan, Euclidean, Chebyshev).
- Designed a 4-layer architecture (data, domain, control, presentation) with both a CLI and a tkinter GUI.

HACKATHONS & ACTIVITIES

MaLeap (ماليب) — Salam Hack 2026

[GitHub ↗](#)

- A personal finance app built during Salam Hack 2026, offering AI-powered recommendations to support users in making smarter financial decisions through intelligent analysis and interactive visualizations.
- Led frontend/UI-UX design (dark navy fintech aesthetic) as part of a 3-person team under hackathon time constraints.

GradShow — 90Soft Training Program

- Completed a software engineering training program at 90Soft; built GradShow, a graduation showcase platform connecting students, companies, and admins, as the program's capstone project.

GitHub: github.com/mymona-muhisen/Gradshow · Live: gradshow.pages.dev

Level 2 Competitive Programming Training

- Qualified via placement test and completed advanced-level training for the university's competitive programming track.
